

Can You Reverse Type 2 Diabetes?

Diabetes and Your Pancreas

Health & Views

DECEMBER 1st issue 2023

Compiled by Dr Harold Gunatillake OAM, FRCS, FIACS, FICS, AM(Sing), MBBS(Cey).

What is the prevalence of colon cancer in Sri Lanka?

Colorectal cancer (CRC) is currently among the top five highest incidence cancers in Sri Lanka (SL), with a age-standardized rate of 10.2 per 100,000 population in 2019.

What are the statistics of cancer in Sri Lanka?

the year 2019, a total number of 31,848 patients were newly diagnosed with cancer, giving a crude incidence rate (CR) of 146.0 per 100,000 population. Crude incidence rate of males was 140.6/100,000 and Crude incidence rate of females was 151.1/100,000 population.

What type of cancer is common in Sri Lanka?

Cancers of the breast, oral cavity, oesophagus, cervix, lungs, thyroid, colon & rectum, lymphoma, ovary and leukaemia are the ten most common cancers in Sri Lanka in the years 2001- 2006

People With Diabetes Have a Higher Risk of Colon Cancer: Study

Written by Lisa O'Mary

Research shows that people with Type 2 diabetes have a 27% greater chance of developing colon cancer as compared to their non-diabetic peers. Equally or more disturbing is that diabetes has a negative effect on overall survival if you're diagnosed with colon cancer.

Nov. 14, 2023 – People with diabetes had a 47% increased risk of getting colorectal cancer, compared to people without diabetes, according to results of a large new study. Getting a colonoscopy dramatically reduced the risk, the results showed.

The [findings](#), published today in *JAMA Network Open*, suggest that colonoscopies are particularly important for people with diabetes. People diagnosed with diabetes within the past 5 years have the greatest colorectal cancer risk, the study found, suggesting screening should be part of a person's health care after they're diagnosed with diabetes.

Researchers analyzed data for 54,597 people who contributed at least 2 years of health data as part of a study that recruited people from 12 southeastern states between 2002 and 2009. The people self-reported their diabetes status, and although researchers tried to only include people with type 2 diabetes, it's possible that some people in the study had type 1 diabetes. The average age of those in the study was 51 years old; 64% were women; more than half of them had an income of less than \$15,000 per year; and 66% of them were African American.

Turn Your Daily Walk Into a Workout

This accessible and convenient form of exercise can help your body do much more than shed pounds. Here's how to start and stick to a walking routine.
